DETAILED ACTION

Response to Amendment

- 1. This action is in response to the Applicant's amendment filed Feb. 10, 2004.
- 2. Claim 7 is amended, claims 10 12 are added, claims 1 12 are pending on this application. Claims 1, 7, 12 are independent claims.

Response to Arguments

3. Applicant's arguments, filed Feb. 10, 2004, with respect to the rejection(s) of claim(s) 1- 12 under 35 USC 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made over **Best** in view of **Rigal** and further in view of **Little et al.**

Claim Rejections - 35 USC § 103

4. Claims 1, 3 –7, 9, are rejected under 35 U.S.C. 103(a) as being unpatentable over Best, (U.S. Patent No. 4,465,901) in view of Rigal (U.S. Patent No. 5,881,155).

Regarding claims 1, 7, Best discloses the art of cryptographic microprocessor authentication protocol, which resides in an electronic circuit chip (see Fig.1) comprising:

Page 3

Application/Control Number: 10/058,651

Art Unit: 2132

- a) a memory for storing information defining an encryption procedure assigned to the electronic circuit chip (see col. 4, lines 47-52, and col. 4, lines 57-60)
- b) at least one input to the electronic circuit chip for writing, to the memory, the information defining the encryption procedure assigned to the electronic circuit chip, and for receiving data to be encrypted by the encryption procedure assigned to the electronic circuit chip (see col. 4, lines 41-56)
- c) encryption circuitry for reading from the memory the information defining the encryption procedure assigned to *the electronic circuit chip*, and for encrypting the data from said at least one input to *the electronic circuit chip* according to the encryption procedure assigned to *the electronic circuit chip*, to produce encrypted data (see col. 6, lines 19-21 and col. 7, line 60 col. 8, line 4);
- d) at least one output from the electronic circuit chip for transmitting the encrypted data produced by the encryption circuitry (see col. 7, lines 45-47);
- e) wherein the electronic circuit chip is constructed so that the information defining the encryption procedure assigned to the electronic circuit chip cannot be read from the memory from any output of the electronic circuit chip (see col. 5, lines 56-60, and col. 13, lines 14-29)
- f) wherein the electronic circuit chip is constructed so that it is virtually impossible to recover the information in the memory by probing, inspection, or disassembly (see col. 16, lines 42-50: "If the enciphered program is small enough it may be stored in ROM in cipher or transposed form on the crypto-microprocessor chip to

Application/Control Number: 10/058,651 Page 4

Art Unit: 2132

prevent a pirate from reading the program from a photographic enlargement of the chip or by probing an easily found internal bus.....", and col. 18, lines 26-37)

g) Best discloses metal, oxide and semiconductor (MOS) but does not specifically mention a metal shielding layer over the memory. However, Rigal in analogous art discloses a metal shielding layer (see FIGS. 5 and 6, and col. 6, lines 30-37: ".... Guard ring 50 is a metallic layer used to electrically isolate the protected chip from external electrical influences. Its specific dimensions are not of particular importance. For example, guard ring 50 can be formed at the periphery of the protected chip 10 and on a surface of the protective chip 20..") It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Best with a metallic layer over EEPROM as taught in Rigal. One would have been motivated to substitute the metallic layer in Rigal in order to reduce tempering capability, so that the information stored in the memory cannot be read by visual inspection or probing and the information can also be resistant to interference, which enhances protection of the confidential information stored in the chip.

Regarding claims 3 and 9, Best discloses the electronic circuit chip, wherein the memory is an electrically erasable and programmable read-only memory (see col. 14, lines 3-7: "If the S-boxes are electrically alterable read-only memory then a battery is

Art Unit: 2132

not needed and loading circuit 76 would be changed accordingly." and col. 20, lines 46-61).

Page 5

Regarding claim 4, Best discloses the electronic circuit chip, wherein said encryption circuitry includes a microprocessor for computing the encrypted data (see col. 18, line 66- col. 19, line 12).

Regarding claim 5, Best discloses the electronic circuit chip as claimed in claim 4, wherein the microprocessor is constructed to execute an encryption program stored in the memory, and the encryption program defines the encryption procedure assigned to the electronic circuit chip (see col. 19, lines 36-57).

Regarding claim 6, Best discloses the electronic circuit chip as claimed in claim 4, wherein said microprocessor is programmed to read an encryption key from the memory, and to compute the encrypted data using the encryption key, and the encryption key defines the encryption procedure assigned to the electronic circuit chip (see col. 5, line 63- col. 6, line 12).

Regarding Claim 12 (NEW), Best discloses an electronic circuit chip comprising:

- a) g) These limitations encompass the same scope of the invention as that of the claim 1. a g, therefore these limitations are rejected for the same reason as the claim 1. a g.
- h) Rigal in analogous art discloses the electronic circuit chip is a semiconductor integrated circuit chip, the memory is an electrically erasable and programmable

Art Unit: 2132

read-only memory (*EEPROM*), and the *metal* shielding layer over the memory is an upper layer of metal on the electronic circuit chip; (see **Rigal**, col. 4, lines 53-62, ".....provided with an electrically erasable memory (*EEPROM* or flash *EPROM*), a volatile memory (*RAM*) and encryption capabilities." and **Rigal**, FIGS. 5 and 6, and col. 6, lines 30-37: ".... Guard ring 50 is a <u>metallic layer</u> used to electrically isolate the protected chip...) It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify **Best's** semiconductor chip, with the metal shielding layer over the EEPROM as taught in **Rigal**. One would have been motivated to substitute the *type of* chip as **Rigal** in order to make a reliable and efficacious solution for enhanced security against an unlawful attempt to gain access to data stored in a security device.

i) wherein the microprocessor is programmed to read an encryption key from the memory, and to compute the encrypted data using the encryption key, and the encryption key defines the encryption procedure assigned to the electronic circuit chip. (see **Best**, col. 6, lines 48-55, and col. 9, lines 54-57: "Crypto-microprocessors which use this encryption method are shown in FIGS. 1, 8, 9, and 15. To decipher a byte the enciphered byte is exclusive-ORed with a scrambled function of the byte's address.")

Application/Control Number: 10/058,651

Art Unit: 2132

5. Claims 2, 8, and 10, 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Best, (U.S. Patent No. 4,465,901) in view of Rigal (U.S. Patent No. 5,881,155) and further in view of Little et al. (U.S. Patent No. 5,998,858).

Regarding claims 2, 8, Best discloses the electronic circuit chip with a type of semiconductor integrated circuit chip (see col. 18, line 66- col. 19, line 12), however, Best's chip is not monolithic semiconductor integrated circuit chip. Little discloses a monolithic semiconductor chip (see col. 18, lines 26-37: "The electronic data module 100, is designed to hermetically house a monolithic semiconductor chip 135 that may comprise a host of circuit elements such as memory, microprocessors, multiplexing circuitry and electrostatic discharge protection circuitry.") It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Best with a monolithic semiconductor chip as taught in Little. One would have been motivated to substitute the monolithic semiconductor chip in Little in order to enhance detection associated with an unlawful attempt to gain access data stored in the chip.

Regarding claims 10, 11 (NEW), Best discloses the electronic circuit chip as claimed in claims 1, 7, wherein the electronic circuit chip is a monolithic semiconductor integrated circuit chip, (see Little, col. 18, lines 26-37) the memory is an electrically erasable and programmable read-only memory, (see Best, col. 14, lines 3-7, and Rigal, col. 4, lines 53-62) and the metal shielding layer over the memory is an upper layer of metal (see Rigal, col. 6, lines 30-37) on the electronic circuit chip. (see Best, col. 16,

Page 8

Art Unit: 2132

It would have been obvious to one of ordinary skill in the art at the time lines 42-46) the invention was made to modify Best with a metallic layer over EEPROM as taught in Rigal and monolithic semiconductor chip as taught in Little. One would have been motivated to combine the metallic layer in Rigal and monolithic chip in Little in order to make an effective chip for reducing tampering capability, so that the information stored in the memory cannot be read by visual inspection or probing, which enhances protection of the confidential information stored in the chip.

Contact Information

Any inquiry concerning this communication or earlier communications from the 6. examiner should be directed to Kyung H Shin whose telephone number is 703-305-0711. The examiner can normally be reached on 6:30 am - 4:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on 703-305-1830. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic
